Design

What went well on the project:

I tried to plan everything that should be included on the website in advance. Colors, font, components etc. So the expression on the page was almost as I wanted. I have also previously found it a bit difficult to download and start with bootstrap / sass and strapi. I think I had better control over that in this assignment. I also think that my color choice was nice and matched the design. The color choice is inspired by TV 2's logo.

What was difficult/didn't go well on the project

I started with js code and had to style the page after that. I have downloaded sass and organized the files sass / scss, these worked first and I started creating custom variables. I placed the variables where they should be, and it worked. And suddenly they stopped working. I have tried to find out what went wrong there, but this happened at the very end before submitting and I have to admit that the air had gone out of me and I had to submit the assignment. So I changed it to regular css. But hope you see what I was really trying to do there.

What would you do differently next time

Plan even more details about the design in advance, such as: How big should the buttons be, font-size h1, h2, h3. Due to time, I have not been able to add so much texture, etc. I want to work more with that later. I made a simple version of the logo this time. Maybe work more on that.

Technical

What went well on the project

I think I have managed to solve javascript in an ok way this time. I still struggle a lot to understand the language, but I have watched different videos over and over again and got some help from fellow students and teachers, I have managed to put together a website that works.

What was difficult/didn't go well on the project

I feel that I have gained a better understanding of javascript this time. But I have worked LOTS with this. This means that I have less time for styling and refining the page. My plan was to get all the big js codes done first, then use the time I had left for styling. In other words, I prioritize the functionality of the page over the design. So the fact that I spend a lot of time on js and get less time for design is what I find difficult.

Otherwise, it has been difficult with time for me. The first two weeks I did very little. This is due to covid at home. Luckily I got extension in 5 days. But with 5 days against losing almost 10 days, I felt the time pressure. So I have been working on the task for many hours per day. It probably results in me having a few hours I sit working where I am tired and not quite able to think clearly. There is nothing wrong with the effort, I guess.

What would you do differently next time

I don't want to do so much differently really. I think my strategy of creating the big and most important codes first and having less time for styling is ok. This will get better as I learn js. And hopefully we will stay healthy and I will not get as much time pressure as I have had this time.

Things I still feel I did not manage to do:

- Make updated quantity on the cart icon.
- Remove border on nav menu when it is active.
- Make the pictures in details appear in the correct size
- Create an alert message that the product has already been added to the shopping cart when you press "add to cart" several times (there is now only a message in the console.log about this)
- In the edit product code, now you have to add a new image as well, I want you to be able to edit a product without having to upload a new image.
- When you delete a product from the cart, there is no message that the cart is empty until you reload the page. I want the message to come as soon as you delete the last product.
